# **Goose Chaperone**

Team: SDDEC19-17 Weston Berg | Zhihao Cao | Alec Morris | Johnson Phan | Woodrow Scott

# Project Design

# Introduction

**Problem Statement** 

- Canadian geese nesting on private property
- Destroying property, harming humans

Our Tasks

- Build autonomous robot
- Oust geese from selected area

https://www.buzzfeed.com/sarahaspler/you-win-some-you-goose-some

# Requirements

### Functional

- Robot must have sensor(s) capable of recognizing geese
- Robot must be able to aggregate data from multiple sensors and act accordingly
- Robot must be capable of movement via motorized wheels

### Non-Functional

- Software implementation platform-independent and scalable where possible
- Abide by relevant laws

### Constraints

• Total cost of robot may not exceed \$400

# **Similar Products**

Goose Guardian

• Equipped with camera for goose recognition but does not move

SMP Bird Control Robots

- Very similar in functionality and design
  - Different models come with different deterences

# System Components

# Logical Relationships

# Structural Integrity

### Summary

- PVC 1" solid core
- Platform for
  - Stepper Motor
  - Camera
  - Sensor
- Batteries and Controller
- Left and Right Wheels
- Elbow PVCs Balancer

### Function

- 1. Durable/Resistant
- 2. Front View
- 3. Fewer Back Attack
- 4. Almost Perfect Rotations
- 5. Balance and Lesser Friction

### Issues

- Exposed Wires
- Weak connectivity weaken certain components

# Movement System

Hold Vision Platform

Wheel Operations

**Two 12V Brushed Motors** 

12.6V/3A Power Source

### Summary

•

- Function Single 5V Stepper Motor
  - Swivel camera, distance sensor left and right
    - Allow robot forward, reverse, 2. and turning movement

### Issues

- Brushed motors work, yet it cannot  $\bullet$ move model
  - Improper physical or electrical connection, motors too weak, faulty PWM chips

# **Distance Detection**

# Summary

- Ultrasonic distance sensor
  - Object and distance detection
- Beaglebone as power source

### Function

- 1. Warn bot's mainloop when approaching objects
- 2. Allow bot to move to a specified distance away from an object

### Issues

None

# Vision System

### Summary

- Logitech Camera
- Tensorflow and OpenCV
  - Tensorflow identifies targets
  - OpenCV controls camera and visualizes detections during testing
- Swiveled by stepper motor
- Captures and analyzes around 10 images per second

### Function

- 1. Primary: Geese detection
- 2. Secondary: People detection
- 3. Rotation for wider coverage
- 4. Provide detection results for bot logic

### Issues

 Currently only supports goose and human detection in code, does not reliably detect sand traps and water hazards

# **Navigational System**

- GPS Module- Adafruit Breakout GPS
  - Low power, 10 HZ updates.
- Python Script
  - Gets raw data from GPS module
  - Data is sent through UART on Beaglebone
  - Data is then parsed for use in program
- Issues
  - GPS can only get a fix outside
  - Insufficient time to combine with main program

#### Above Right:

Diagram of GPS connection to board. *Right*: Raw data from GPS before it's parsed for relevance. *Left:* Photo of GPS Module connection.

#### Command Prompt

:\Users\alwau>

# Software

# Software Relationships

# **Driver Implementation**

# Adafruit\_BBIO

- Preferred over native Bonescript + Node.js
- Exposes GPIO, PWM, UART, etc. to Python

## **Design Patterns**

- Singleton
- Object-oriented

### **Decoupled Configurations**

• Initializes functions

# Tensorflow

- Developed by Google Brain Team
- Used for creating and executing deep neural networks

### Image Processing

- Easiest method is to use existing trained model
- Different architectures provide different costs and benefeits
- We used SSD\_MobilenetV1 originally trained on the COCO set
- Models retrained via feeding large tagged image sets and undergoing regression training

# Bot's Mainloop Logic

### Detection

- Shrink and feed image through tensorflow
- Filter results to return detection classes of humans and geese
- Data contains confidence percentage of detections and bounding box coordinates

### Roaming

- 1) Scan each direction via swivelling the stepper motor
- 2) If target found, charge towards target
- 3) Otherwise, continue along route

# Demo

# Conclusion

### **Project Successes**

- Successful component testing with proper compatibility to Beaglebone
- Created working Tensorflow model that can classify geese and humans
- Built usable chassis from scratch
- Knowledge gained on previously unexplored topics
- Laid groundwork if project picked up by senior design group in the future

### Project Issue and Challenges

- Desire to find "perfect" solution led to short-sightedness on ease of development
- Long planning period reduced overall development and testing time
- Late assembly did not allow enough time to diagnose and fix motor problem
- Single microcontroller slowed development

# Question?
